The file name is stored in a variable as FileName = "[id]" & ".xlsm" I need to fetch the name of the file "Excel 2013.xlsm". What should I do? Edit: The word document is being converted to a pdf using MSWord. The URL of the word document is given to me by user. How can I extract the file name

Features Key:

Simple Operation This game is a beauty that does not require more than three taps to intuitively control.
Easy to Learn Enjoy seeing things in action with the simple display that does not interfere with the player's gameplay. Learn new skills through the training dummy, and get through the tutorial by yourself.
Useable in the Next Generation A game that uses the next generation API that lets you use the game without a personal computer thanks to your smartphone or tablet.
User Generated Content Enabled Enhance your game by adding to the game world and challenge your friends through various tools.
Fun of Crafting Craft weapons and armor with materials and items you find in the world, or complete rare recipes that are a hit even with the hard-core player.
Meticulously Crafted Legendary weapons and hand-crafted armor. Even after downloading, you can enjoy a rich gaming experience with hundreds of thousands of customized online play elements.
Weapon crafting is performed through the Crafting Gauge that can be obtained as a reward of battle,

with the result of the success rate determined through the crafting item's level.
Remote Play with Your Companion Transfer your friend's game data from other platforms. In addition to being able to play with your companion, you can use the data to travel to other platforms and games even when you're not in a companion app.
Elden Lord In addition to directly participating in the story, you can also become a powerful Elden Lord and enjoy your own story within the game world. Experience various exciting events through the Protagonist's Bond System, as well as participate in the action, which is powered by Party, in real time, as you create your own story.
