For those who just want to get started with Photoshop, this is the best program for you. How many layers can I have in one image? Photoshop Elements comes with 50 layers in it's basic application. As you gain more experience you can add more layers or create new ones in other programs. Photoshop comes with standard layers for creating and manipulating raster images. Like image editing, layers also have some cool properties. Layers can be grouped together to reveal or hide content. Instead of placing something on top of the image like it would in a photo editing program, you place it on a layer. You can then adjust any layer's properties at any time, without affecting the image. Layers are also scalable, so you can make any of them larger or smaller. You can also move and resize layers. You can even change the transparency of the image based on a layer's transparency. This enables you to manipulate the appearance of different objects in an image. Why use layers? Layers enable you to combine elements into one object. For example, you could put a logo in one layer and then a company's primary colors in another layer. You could then edit any of the layers to your liking. If you want a line and circle element, you could put them on a layer to edit the line separately from the circle element without making it touch the circle. You can do this to create a unique look for your next project. You'll find that using layers will make your images more creative and visually unique than images created by simply adding a photo to a photo. How do I work with layers? Click the layers icon on the tools bar (you can find it after pressing CTRL+T on your keyboard or pressing J on your mouse) to display a list of your layers. You can easily tell which layer is on top by clicking the little upward triangle at the bottom. You can double-click on a layer name to open it and view or change its properties. You can click on a layer to select it and move it to any other position in your document. You can then drag it to any position within your document. You can duplicate the layer by pressing CTRL+D while selected. You can merge layers by holding CTRL and clicking on the layer in the Layers panel. You can deselect layers by

1. Field of the Invention The present invention relates to technology for managing path switching by using a network load control device such as an electric power system stabilizer (ESP) that controls a distribution system of electric power. 2. Description of the Related Art Electric power distribution lines and other electric facilities are classified into normal operation, standby operation, and test operation. By performing maintenance of electric power facilities that are in the standby state, the distribution of electric power in the grid is stabilized. Among other purposes, the electric power system stabilizer (ESP) is provided for stabilizing the electric power distribution lines. Among other modes of operation, there is a management control mode (RCCM: Rapid Control of Distribution System Mode) in which the electric power distribution lines are controlled in both the normal operation and standby operation. In the management control mode of the electric power distribution lines, the electric power system stabilizer performs path control (path switching) as a way of controlling the electric power distribution lines, and maintains the grid in a stable state. The electric power system stabilizer controls power transmission lines (Lagos) by means of a line setting unit (LSU) so as to maintain the grid in a stable state. When path switching in the electric power system stabilizer is performed, the electric power system stabilizer designates target points of power transmission (line path points) as a target of path control. In this case, the electric power system stabilizer specifies the electric power transmission line (target path) that serves as a target of path control as a path to be switched, and designates the path switching control object electric power transmission line (path switching line) with regard to the specified target path. Japanese Patent Application Laid-Open Publication No. 2005-347870 discloses a distribution system that includes a central control device (CCD) and an electric power system stabilizer, a distribution line having
